The Direct Selection tool enables you to select specific areas of the image. This tool is useful for creating masks. You can create a selection around an object in an image, then apply a mask to it to protect specific parts of the image from effects, etc. The Healing Brush can be used to match the tone and color of an area to another. If the color is off, or the tone is off, the tool will attempt to make the color match to a reference image. The Spot Healing Brush can select an exact area to correct it. The tool is useful for removing blemishes, correcting color mistakes or picking out small areas of the image that were accidentally selected. The Soft Selection tool can select soft areas of an image. It is useful for copying an area as a selection without having to select the area first. The Type tool can be used for creating texts. This tool allows you to insert or edit text into the image. The Type tool can be used to create signature, phone number, text or any other special information into an image. If you're a new user of the program, you might be wondering what the different brush tools are and what they can be used for. In this tutorial, I'll show you the difference between the nine most common brush tools and give you an idea of how to use them in different situations. (If you want to see all the brushes in the program, check out [Photoshop CS5 Brush Reference](#).) For example, the first brush is the Airbrush tool. This brush creates a very fine line of paint that can be used to paint realistic-looking shapes over an image. The second brush is the Paintbrush tool. This brush is used to create a line of paint. You can use this tool to paint different strokes over an image. Use the Paintbrush tool to create a watercolor-like texture over an image for a grungy effect. The 3rd and 4th brushes are both called Quick Selection brushes. Quick Selection brushes make it easy to isolate a region of an image (such as a color) and use that region to create an effect. The next two brushes are both called Eraser brushes. The 2nd Eraser brush is often called the Eraser. This brush doesn't create paint, but rather gets rid of it by erasing pixels. You can use the Eraser to erase an entire image. This brush is also great for removing unwanted objects from a picture. The next two brushes are also Eraser brushes. The top-left is the Smooth Eraser brush. This brush is used to smooth out unwanted objects and create a more realistic-looking image. The Smooth Eraser tool is good for repairing damaged or patchy images. The next brush is the Spot Healing Brush. This brush is used for retouching, such as removing blemishes from your face. You use the Spot Healing Brush to point the cursor at an area in your image (such as a pimple), then use the Eraser tool to erase areas of the image that aren't necessary. The fourth brush is called the Clone Stamp. You use the Clone Stamp tool to copy pixels from one area to another. You can copy pixels for a variety of purposes, such as retouching an image. You can also use the Clone Stamp tool to reproduce missing or damaged parts of your image. This is great for transferring the appearance of one object to another image. The Brush Selection Tool, which is used for selecting a brush, is the fifth tool.
