Find your way through the animated forests and fields of Wonderland...Biomechanical study of the effects of bilateral sagittal split ramus osteotomy and stabilization on the mandible and condyles. This study quantitatively examined the effects of bilateral sagittal split ramus osteotomy and stabilization on the mandible and condyles by a biomechanical testing procedure. Nine pairs of mandibles were tested by pull-out testing with three-point bending. Each mandible was divided into three segments: the mandibular portion with the resected ramus, the midportion between the mandibular and glenoid fossae, and the coronoid portion with the coronoid process. A horizontal line parallel to the line of the long axis of the condylar neck was drawn on the fossa. The maximum tensile force (F₀) was recorded at the condylar neck. As the magnitude of the F₀ was enlarged, the forces measured at the mandibular and coronoid portions were both increased. However, as the magnitude of the F₀ was increased, the forces of both the mandibular and coronoid portions were reduced. The resistance of the coronoid fossa to the posterior bending moment was elevated by the cleaving or splitting of the coronoid process into two parts. These forces were increased in proportion to the magnitude of the F₀, and the forces at the mandibular and coronoid portions were reduced, with the forces being higher at the mandibular

What's new in Sprout Lands:

Sprout Lands, also known as Sprout Point Peninsula is located on the southern shore of Vancouver Island, in British Columbia. The peninsula is occupied by a privately owned research facility, staffed by the Canadian Department of Fisheries and Oceans (DFO), and one of its scientists, Dr. Murray Watt, a vertebrate ecologist, and is part of Point Grey. Nearing completion in the year 2003 (as of 2003), Sprout Lands hosts three facilities: a research animal husbandry and bleaching facility, a whale rescue and rehabilitation facility, and the Pacific Whale Watch Center. The work on the point includes the distribution of two thousand bags of natural fish-eating crabs around the island, and the cleaning of whales after washing out or stranding. On the whaling side of things, West Coast Whaling Inc. is currently offering a whale watching service to the public. Once a farming community, the area is now being reforested with spruce and other new trees. Harvesting of spruce trees began in 1993 with 572 metric tons being planted. Subsequent harvests to start in 2000 are set at between 1,200 and 1,600 metric tons. Approximately 15.4 hectares of spruce trees were planted on Sprout Lands in May 2000 and currently there are nearly 4 hectares planted. As of 2003, the main purpose of Sprout Lands was the increase of sea life but as of May 2008 that purpose has changed to a more environmental one. A very important effect of sprouting spruce forests is to prevent the loss of fish numbers on the nearby Vancouver Island. History of the Sprout Lands Following the establishment of the British Empire during the first half of the 19th century and the launch of the Colony of Vancouver Island, the presence of settlers began to increase. Before the 1880s, the watershed area of Sprout Lands included some 1,300 hectares of grazing land referred to as Victoria Ridge. Victoria Ridge was believed to be a relatively flat site. Partly because of this geological feature, light disturbance of the land, and the beach, the land eventually became a popular tourist and vacation destination of the Vancouver area. It was something of a thriving community, hosting residents such as Dr. Saul. While the town was in its early stages, it eventually started to decline and become a minor tourist destination, local neighbourhood, and area to avoid. In the mid-19th century, the loggers moved
