The discovery of a previously unknown bug in the bitcoin blockchain — which the company claims is “tentatively the worst vulnerability in the world” — is likely to catch the attention of regulators worldwide, as well as concerns that the Russian government will try to use the bug to stifle cryptocurrencies. The discovery by an East German cryptography expert, who has not been named or revealed his background for security reasons, will initially be kept secret to preserve the anonymity of the researcher. The bug, discovered by a team of four at a risk consultancy firm called White Ops, and reported to a leading bitcoin security firm, was in an ancient program, called the “getbestblock” function in the bitcoin source code, written at the beginning of 2013. According to White Ops, the code “can be used by a malicious peer in a coordinated fashion to modify transaction and block balances on the network.” The bug only affects a single bitcoin blockchain version, version 0.8, which was released in December 2013. When this code was released, there were only 21 million bitcoins in existence. The existence of an unlimited supply of this type of cryptocurrency was a principal driver of bitcoin’s immense recent appreciation, and the adoption of bitcoin by the Russian government was one of the big drivers of this appreciation. This bug means that bitcoin was released with a bug that allows somebody to control billions of dollars’ worth of the bitcoin network. The discovery of this bug has drawn sharp criticism of the bitcoin network from the bitcoin developer Gavin Andresen, who is the director of the Bitcoin Foundation. ❖

Using the Brush Tool To use a brush, click on the Brush tool in the Toolbox and select a brush style from the Tool Options bar. Each brush can be modified by adjusting its Size, Shape, Hardness, and Opacity (the tint of the paint). Hardness is the degree of resistance the brush has to the paint. A really soft brush will let the paint flow, and a hard brush will drag it. Opacity is how much of the paint you see. The lower the opacity, the more paint you see. There are two types of brushes: Radial brushes Radial brushes are used to create a brush stroke by setting the direction of the brush. The strokes may be from the center of the brush, away from the center, or in a specific direction. Creating the brush stroke To create a brush stroke, hold down the Alt key while you drag over the canvas. Alternatively, you can use the Pencil tool for an even smoother result. When the pen tool is released, you'll see a radial line that can be adjusted. Paths Paths are essential when you are creating patterns. There are four basic types of paths in Photoshop: Rectangular path Round-robin path Elliptical path Spiral path To create a rectangle path, start drawing the rectangle you want to use. Once the line is drawn, it will be a rect path. You can resize, rotate or mirror the path. You can also move the path to create a new path. Creating round paths To create a round path, start drawing the shape you want to use. After you have made the first shape, select the path object and press Ctrl + D. This will convert the path to a round robin path. When you draw the second shape on the path, select round robin path from the path tools, and you will convert it to a path that is round. To use the round robin path, right click on the shape you want and choose round robin path. This converts it into a round path. Creating elliptical paths To create an elliptical path, start
