_fig_1_ ## **Introduction** Photoshop is the industry standard for image editing software. However, there are more than 60 image-editing programs available. Some use more complex editing methods, others have more features, and some are better suited to certain types of jobs. **Figure 1.1** With Photoshop, editing is usually done in a layer-based system. This works on a base image, which is called the canvas, and a few dozen layers that overlay each other and can be combined and moved around (see Figure 1.1). On the first layer (topmost layer) are the colors, shapes, and fonts. On the layer below is the image. Next, images are added to the layer, and they are painted, cut, moved, or inked. When the image is complete, you can open the file in another program to print the image, apply a special effect, or use another layer. Also, Photoshop allows users to create Smart Objects, which are like cloned images and retain the layer's editing history.

, and 1,000,000, and 1,000,000 pages. The area filled by the noise, which is equal to 10% of the total area, is set to 1,000,000. While we conducted the experiment 1000 times, there was one case in which the results did not match the expected ones. Therefore, we conducted the experiment 10 times, and then the average processing time of 10 cases was obtained. The results are listed in the following table. 6.2. Analyzing the results Table 5 lists the results of the experiments. The experimental conditions are as follows. 6.2.1. Comparison of processing time In terms of processing time, the orthogonal slits method and the parallel slits method are about 10 times faster than the nested slits method. When the noise area is fixed at 10% of the total area, the nested slits method is 30 times faster than the orthogonal slits method. When the noise area is fixed at 50% of the total area, the nested slits method is 60 times faster than the orthogonal slits method. 6.2.2. Comparison of noise removal quality In the above two experiments, the results show that the noise is different in the different depths. In other words, in the deep layer, the noise is difficult to remove and severe. In the shallow layer, because of the short distance between the parallel slits, the noise is difficult to be removed and smooth. The orthogonal slits method can remove the noise efficiently in the deep layer, and can maintain its quality. Therefore, the noise removal quality of the orthogonal slits method is the best. 6.3. The space filling method Figure 9 is a two-dimensional view of a space-filling curve. It is mainly used for solving the problem of overlapping points. The two-dimensional space-filling curve is usually defined by the following equation: $x = a \cos w + (n-1)(-b) \sin w$ where $a > 1$, $w \leq \pi/4$, and $0 \leq \rho \leq \pi$. In the experimental method, the curve is an elliptical curve in the following form: where $a \leq 0$, $b \leq 1$, and $n > 1$. The specific coordinates of the space-filling curve are as follows:

Image caption The bank says it is working as quickly as possible with people whose personal details were included The Royal Bank of Scotland has admitted that the personal details of some 2.5 million customers were exposed in a data breach. When reports of the breach were first announced, the bank said it had identified the 22,000 individuals whose details may have been stolen. It now says it has identified 2,491,000 people as having been affected. The bank says it is working as quickly as possible with the individuals to assess whether their personal data has been compromised. It also says it has hired external auditors to investigate the breach and to assess how many other people in the UK may have been affected. The full list of potentially affected people was posted on the bank's website. They include those with bank accounts, charge cards and credit or debit card transactions between 6 January 2015 and 27 February 2015. The bank said its investigation was continuing and it would be contacting affected customers. The bank says it learned of the incident on 23 February and started working with the Information Commissioner's Office and the relevant regulatory authorities on the same day. The data was stolen from a payment systems software supplier. No hack The news comes just over a week after the bank announced that it had changed the design of its new cards to include a chip containing a 24-digit number. In a statement, RBS said that, "after extensive investigations into the cause of this data breach we are now in a position to confirm that no further breach or malicious activity has occurred and there has been no hack". But RBS also said that it could take some time before its customers are fully informed about how the data breach happened. The bank confirmed that customers with the old magnetic stripe cards would not be affected by the breach. RBS said that it was not yet clear how much data was stolen or the nationality of those who accessed it.Q: why is user namespace so slow in perf? I have a not-simple user-space utility which is getting called for hundreds of thousands of times per second. When I was profiling it via perf, I noticed that user namespace is almost always a bottom 10-15% slowest process. As perf shows, most of CPU time was spent on context switches, so I assume, user namespace (possibly) has to switch many times for every system call.
