Is it possible to alter the stack area that the paged stack works from? It's an application that has a lot of short lived allocations to e.g. static buffers, to strings, etc. And i want to change the allocation of those, to keep them at a local area. This would be a huge win for performance, since each allocation takes time. I have a solution that works and is pretty simple, but not optimal. I keep a linked list of all of the areas of memory. And then I can just move all the allocations to a new memory block, and delete the old one. The problem is, that the size of those memory blocks gets bigger and bigger. I have a system with 128GB RAM, 64 of which I'm using for my app right now. That's more than two times the amount of memory that the old paged stack function

Modern military projectiles are generally fired from a launcher using a mechanical system that rotates the projectile. The mechanical system includes a motor, transmission, and mechanical linkage to rotate a projectile mounted within the launcher. The rotational movement is required to impart the ballistic characteristics that allow the projectile to be propelled from the launcher. When using traditional powder firearms, such as, for example, a M68 rifle that uses a hand-held 70 mm launcher, a round is loaded into the chamber of the firearm and the weapon is pointed at a target to be engaged. The round is released by the shooter pulling a trigger. After the projectile is fired, the projectile rotates causing the projectile to expand and be propelled from the weapon to hit a target. More recently, air guns have been developed that use compressed air or other gas to propel a projectile. When using the air gun, an operator, such as a hunter, can fire a round into the air and the round will be propelled from the air gun to hit a target. Because the air gun can be directed at a target, such as in hunting, air guns are commonly used in military operations. For example, air guns are commonly used by the military for long-range firearms and as a projectile carrier in live fire training. In addition to air guns and traditional firearms, powders can be used to propel projectiles using high-velocity powders that are propelled from a launch tube to propel a projectile from a muzzle end. In a typical application, the ammunition is loaded into a muzzle end that is aligned with a projectile gun. A pressurized charge is filled within the launch tube, which is then fired by depressing the trigger of the projectile gun. Currently, an arsenal of powder weapons is known and ammunition can be found for many of the powder weapons. Once a round of ammunition is used, the round is discarded. Because powder weapons require a long shelf life and because ammunition is expensive, it 6d1f23a050
